

HOOSIER HUSTLE

Promoting sustainable and efficient transportation via urban mobility on the Indiana University Bloomington campus

Background

Our project is focused on finding a solution to promote urban mobility within Indiana University's campus. We conducted primary and secondary research, interviews, sketched wireframes, created concepts, and iterated our various Figma prototypes.

Research

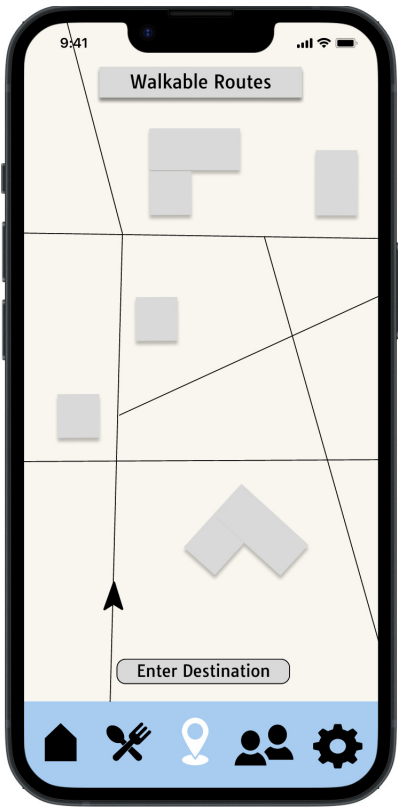

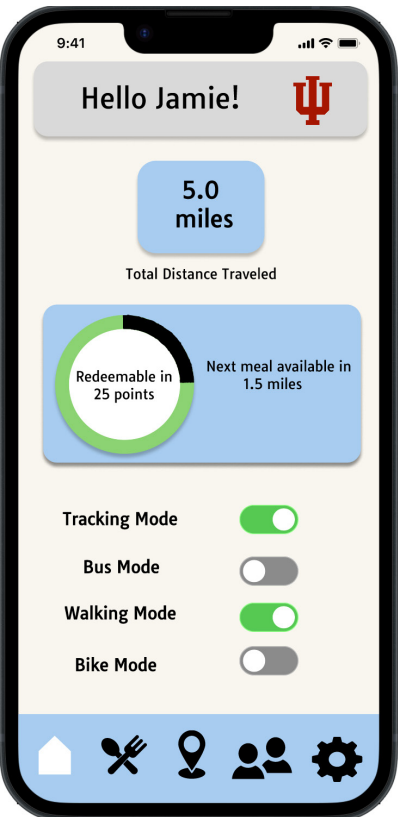

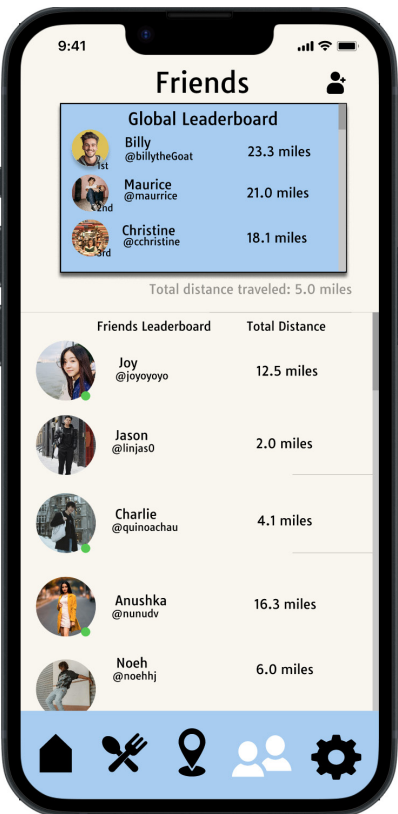

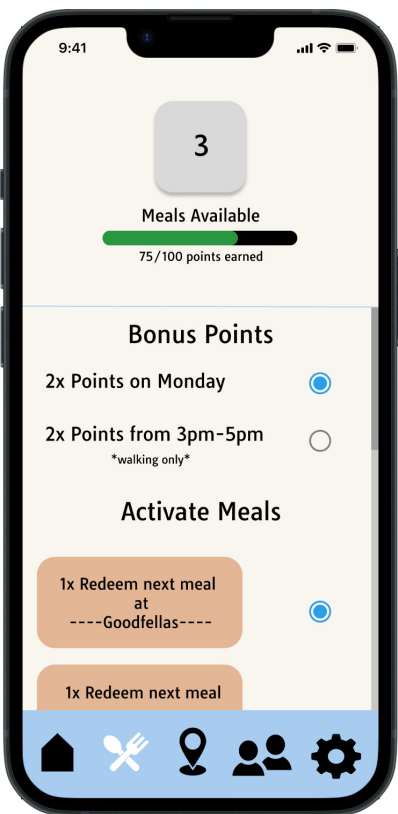

We gathered sources that discussed traffic congestion on campuses similar to IU, and we personally interviewed 12 students who lived on and off campus. Our general findings suggest that Bloomington and IU buses are unreliable, buses are budget friendly, walking can be faster than taking the bus, and 10th street is dangerous for pedestrians

Concept

Hoosier Hustle is an app that incentivizes sustainable transportation choices for IU affiliates. Users compete with friends to earn meal points redeemable at participating restaurants, all while contributing to a greener campus. The app features a global leaderboard and friendly competition to promote eco-conscious commuting habits campus-wide.

Design Process

We began with conceptual sketches and outlined the initial idea for the app. Gathering feedback, we refined the concept to align closely with user needs and preferences. We created low, medium, and high fidelity prototypes in Figma that received critique from user tests, peers, and our AI. The designs underwent heuristic evaluations which enabled us to address usability issues.
